From the Chairman

If there is to be any road sign along the information highway into the cyber world it should read “User Beware”; for all too often, we read about people who fall victim to online schemes and scams. The SKMM Household Use of the Internet Survey 2008 (HUIS 2008) polled users of the Internet who click happily away from the comfort of their homes. It revealed that as high as 71.5 percent of these users do not know what phishing is or how it operates to ensnare them. However, it is comforting at the same time to note that as high as 85 percent of users, instinctively shy away from risky behaviour such as clicking on e-mailed links that lead to spoofed websites designed to steal personal data.

These are among some of the findings from the HUIS 2008 that canvassed some 5000 home Internet users to probe on current issues and concerns regarding Internet usage.

The HUIS 2008 is the third in a series of surveys conducted by the SKMM from its Computer Assisted Telephone Interview (CATI) Centre. The reports from the surveys have proven useful to many users and indeed there have been calls to carry out the survey at more frequent intervals. The present report also brings the corresponding findings and figures of the 2005 and 2006 editions of the HUIS alongside those of 2008 so as to put in perspective, the trend over the period 2005–2008.

The response rate to SKMM surveys has always been high. The HUIS 2008 garnered a response rate of 78.0 percent. I would like to thank those who responded to the survey for without their cooperation this survey would not have been possible. Finally, I would also like to commend the statisticians at SKMM for a job well done.

Datuk Dr. Halim bin Shafie
Chairman

Malaysian Communications and Multimedia Commission (SKMM)

Survey Metadata

Reference Date

The reference date of the survey was set at 31st March 2008. To qualify for inclusion into the sample, a potential respondent must be able to answer “yes” to a screening question on whether he was a user at that date.

Target Population

In the context of this survey, an Internet user is defined as someone, regardless of age, who accessed the Internet for whatever purpose at least once in the past month. Hence the target population is the universe of Internet users who access the Internet from a dialup or xDSL from their own homes at least once in the past month. Note however that in so far as an individual is concerned, this need not be the exclusive means and/or location of access. Other means could be in a hotspot or even at work. Such usage was not covered in this survey. Users of wireless access were also excluded from this survey. It is to be noted that a ‘user’ is not the same as a ‘subscriber’.

Sampling Scheme

This is not a household survey in the conventional sense and the survey was not founded on a household frame.

Two stages were identified in the selection of a respondent.

In the first stage, unique randomly generated PSTN numbers were dialed to screen out numbers other than those of private households. When a household is reached, it is screened to see if it is Internet equipped either via dial-up or xDSL at reference date. If it is, then a user from that household is selected at random. This is done by asking to speak to the Internet user, in that household, whose birthday is next.

Sample Size

With a predetermined $\alpha = 0.01$ and $d = 0.02$ a random sample of 4,925 Internet users in households were drawn to provide national estimates. This survey was not designed to provide sub-national or sub-group estimates.

Stratification was not done because a suitable stratification variable was not available.

Data Collection

The survey was conducted by trained interviewers operating out of SKMM CATI Centre located at Wisma Pahlawan, Kuala Lumpur.

In both user and non-user instances, pains were taken to explain to respondents the purposes and objectives of the survey.

Fieldwork started on 5 April 2008 and ended on 17 June 2008.

Response rate to the survey was 78.11%.

The relatively smaller group of users aged below 15 years in contrast with that of the '15 to 19 year olds' seems to indicate that interest in Internet usage starts in earnest when students are in upper secondary schools beginning with the ninth year of formal education in Malaysia. This interest appears to take hold through to the next age cohort where respondents pursue their first degrees, possibly as a result of intensifying usage of ICT in institution of higher learning in Malaysia.

In broad generational groups, the percentages are as follows:

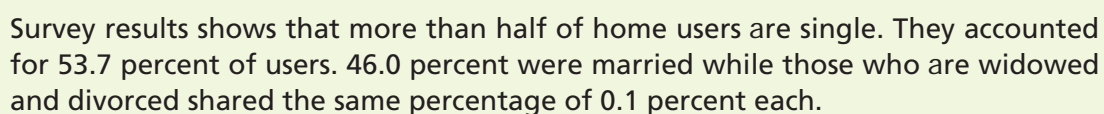

Percentage share of household user base			
Age category	2005	2006	2008
Pre Teens & Teens (up to 19)	25.1	26.0	24.7
Adults (20–49)	66.5	67.0	65.8
Seniors (50+)	8.4	7.1	9.4

Education Level of Users

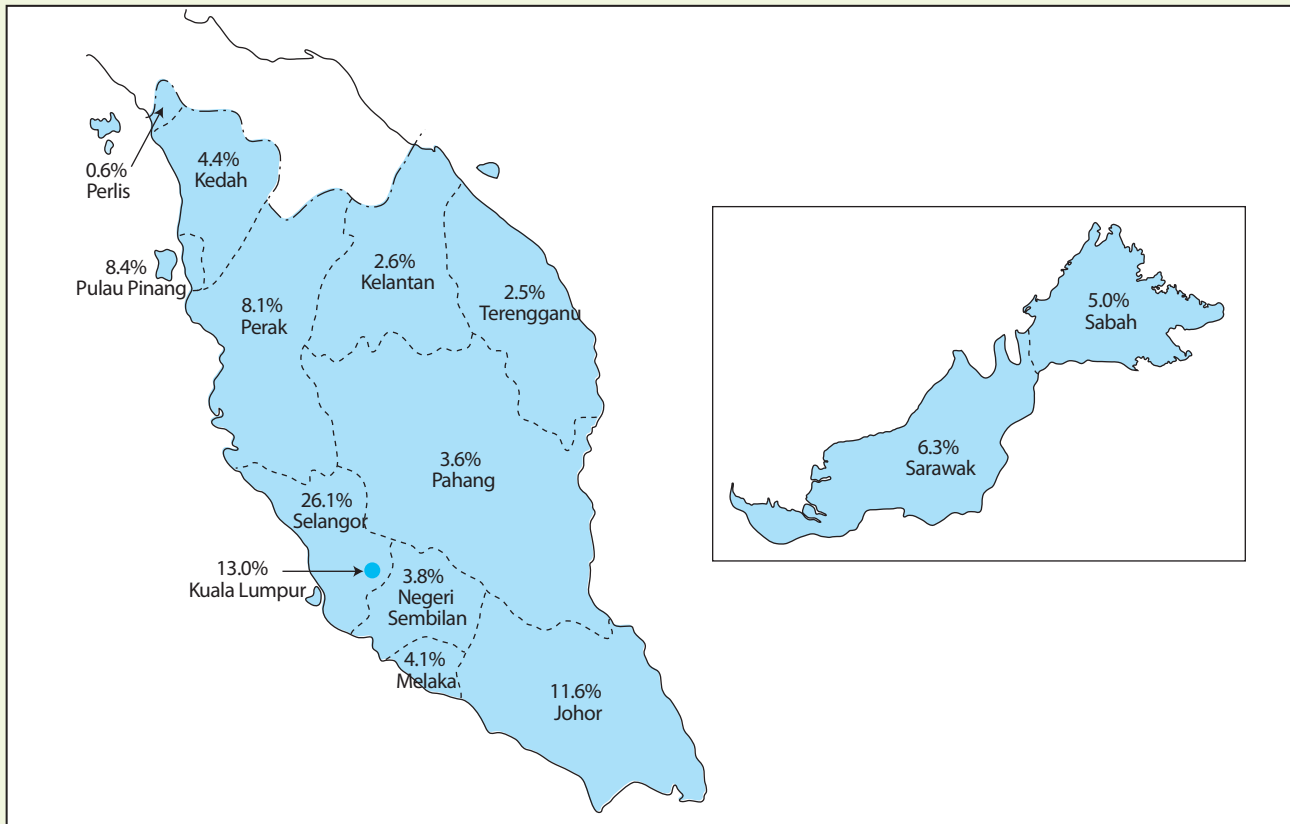

Users who had already finished schooling formed the largest group accounting for 65.1 percent of all users.

Among them, the largest groups are those who have a university degree or higher (35.1 percent), followed by those who have some secondary education (31.5 percent), and those who have a diploma (30.9 percent).

Usual State of Residence

As in previous years, the Klang Valley conurbation had the highest percentage of users. Selangor registered 27.2 percent while WP Kuala Lumpur 13.0 percent. Percentage share for the rest of the states are shown in the table below:

Percentage share of household user base			
State of residence	2005	2006	2008
Johor	10.4	12.1	11.6
Kedah	6.0	4.4	4.4
Kelantan	2.0	2.4	2.6
Melaka	3.5	3.1	4.1
Negeri Sembilan	4.0	3.2	3.8
Pahang	3.7	3.6	3.6
Pulau Pinang	10.7	9.3	8.4
Perak	8.5	8.2	8.1
Perlis	0.6	0.6	0.6
Selangor	23.9	27.2	26.1
Terengganu	2.6	2.4	2.5
Sabah	5.0	4.8	5.0
Sarawak	6.8	6.1	6.3
WP Kuala Lumpur	12.4	12.6	13.0

The graph illustrates the percentage of Klang Valley users in various other states for the years 2005, 2006, and 2008. The Y-axis represents the percentage, ranging from 0.0 to 30.0. The X-axis lists the states: Johor, Kedah, Kelantan, Melaka, Negeri Sembilan, Pahang, Pulau Pinang, Perak, Perlis, Selangor, Terengganu, Sabah, Sarawak, and WP Kuala Lumpur. Selangor shows the highest percentage in 2008 at 39.1%.

State	2005 (%)	2006 (%)	2008 (%)
Johor	10.5	12.5	11.5
Kedah	6.0	4.5	4.5
Kelantan	1.5	2.5	2.5
Melaka	3.5	3.0	4.0
Negeri Sembilan	4.5	3.0	3.5
Pahang	4.0	3.5	3.5
Pulau Pinang	11.0	9.5	8.5
Perak	9.0	8.0	8.0
Perlis	0.5	0.5	0.5
Selangor	24.0	28.0	39.1
Terengganu	2.5	2.0	2.5
Sabah	5.0	4.5	5.0
Sarawak	7.0	6.0	6.5
WP Kuala Lumpur	12.5	13.0	13.0

Monthly Income Category

Most Internet users earned RM1,000 to RM3,000 per month. This group accounted for 46.1 percent of all users. Those in the RM3,000 to RM5,000 bracket were the second largest group of users with 27.5 percent within its ranks. The positive skewness in income distribution is borne out in the chart below:

Methods of Internet Connection

Most home users accessed the Internet via a broadband connection, making up 73.9 percent of all users. The other mode of access is dial-up which accounted for 25.0 percent. The remaining 1.0 percent used both.

Intensity of Use

The average home user spent some 12 hours per week on the Internet.

On analysis, 28.0 percent of home users averaged less than 4 hours per week, while 23.2 percent put in between 4 to 8 hours and 19.3 percent reported between 8 and 15 hours of use. This tapered off as shown in the chart below except for a fringe group of 16.0 percent that chalked up usage of 28 hours or more in a week.

Activity on the Internet

The two main reasons that users went online were to get information (94.4 percent) and to communicate (84.7 percent). This was followed by educational purposes (64.5 percent) and leisure purposes (63.5 percent). Only 31.8 percent do Internet banking while 29.2 percent access public service website with only 19.8 percent doing e-government transactions. Online stock trading drew the least with 5.9 percent of users reporting usage.

Percentage share of household user base			
Internet usage	2005	2006	2008
Getting information	40.5	84.5	94.4
Communications by text	99.6	80.7	84.7
Leisure	47.1	52.7	63.5
Education	46.8	45.9	64.5
Financial activities	14.6	23.6	31.8
Public services	12.7	12.0	29.2
e-Government transactions ¹	–	–	19.8
Online stock trading ¹	–	–	5.9
Others	1.3	0.2	0.7

¹ not canvassed in 2005 and 2006 survey.

Blogs

Knowledge of Blogs

63.5 percent of home users knew what blogs are with 9.5 percent of them having their own blogs.

Access to Blog

Among those who knew what blogs are, only 43.9 percent of them accessed blogs.

Type of Blog Frequently Visited

Blogging communities and directories rate the highest (63.5 percent), followed by media blogs (47.2 percent), blog search engines (42.8 percent), business blogs (19.6 percent) and other blogs (17.5 percent).

Phishing

71.5 percent of home users did not know what phishing is.

However, on the positive side, as high as 84.6 percent were savvy enough not to click on just about any link that comes with an e-mail.

Digital Signature

Only 27.6 percent of home users knew about digital signatures.

28.8 percent of them knew how to go about getting a digital signature.

Tables

Caution is required in the use of the estimates tabulated below.

Whilst the SKMM takes every care to minimise non-sampling errors, which cannot be quantified, the estimates presented are also subject to sampling errors, which is a measure of the chance variation that occurs because a sample, and not the entire population is canvassed. The sampling error of an estimate is usually expressed as a percentage of that estimate to give the relative sampling error (RSE) of that estimate.

In general, estimates that are small are subject to high RSEs. As a guide, only estimates with RSEs of 25 percent or less are considered reliable for general use. Estimates with RSEs greater than 25% but less than or equal to 50 percent or less are denoted with asterisks in these tables and should be used with caution while those with RSEs greater than 50 percent are denoted by two asterisks and are considered too unreliable for general use. However, these estimates may be aggregated with others until an RSE of less than 25 percent is obtained.

Confidence intervals for very small estimates should be based on the binomial distribution rather than the normal approximation to the binomial. As an alternative, the method of Korn and Graubard, 1998 may also be used.

Percentages may not add up to 100 because of rounding. They may also exceed 100 by a substantial amount in the case of questions that allowed multiple responses.
